Homework #1: Due 9/8

Agenda

Finish Lab 1 and start Lab 2 materials

Numpy Arrays:

Similar in some ways to Python lists, but they're potentially multidimensional. They can be not just, as in a list, a single dimension of elements, but more than one. But they are homogeneous in type:

Python list, we have a series of elements in a particular order, and the types of those elements can be anything; they can be numbers or strings or other lists or other kinds of objects

In NumPy arrays, we have a similar sort of positional ordering, but the types are fixed for a given array. So we might have a one-dimensional array of floating point numbers, or floats; might have a 2D array of integers, or ints; or a 2D array of floats;

array shape: tuple of integers describing the number of elements in each dimension

array dtype: datatype of array elements

1.0	2.1	3.2	4.3	5.4	6.5	7.6	8.7
-----	-----	-----	-----	-----	-----	-----	-----

shape = (8,)
dtype = float

1	2	3
4	5	6
7	8	9

shape = (3,3)
dtype = int

0.1	2.3	5.7	9.5
-1.0	3.9	10.8	-3.7
0.0	4.3	7.9	-2.3
-0.1	1.2	-5.7	9.0
-1.1	3.5	4.3	0.2

shape = (5,4)
dtype = float

	1	0	1	1
0	1	1	0	0
1	0	0	1	1
1	1	0	0	

shape = (3,4,2)
dtype = int

Numpy Arrays

array axes: order of indexing into the array

axis = 0: first index coordinate

axis = 1: second index coordinate

etc.

can operate over one axis at a time

Definition and Usage

The `sort()` method sorts the list ascending by default.

You can also make a function to decide the sorting criteria(s).

Syntax

```
list.sort(reverse=True|False, key=myFunc)
```

Parameter Values

Parameter	Description
reverse	Optional. reverse=True will sort the list descending. Default is reverse=False
key	Optional. A function to specify the sorting criteria(s)

pandas.Series.value_counts

`Series.value_counts(normalize=False, sort=True, ascending=False, bins=None, dropna=True)` [\[source\]](#)

Return a Series containing counts of unique values.

The resulting object will be in descending order so that the first element is the most frequently-occurring element. Excludes NA values by default.

Parameters: **normalize** : *bool, default False*

If True then the object returned will contain the relative frequencies of the unique values.

sort : *bool, default True*

Sort by frequencies.

ascending : *bool, default False*

Sort in ascending order.

bins : *int, optional*

Rather than count values, group them into half-open bins, a convenience for `pd.cut`, only works with numeric data.

dropna : *bool, default True*

Don't include counts of NaN.

Returns: **Series**
